asremlPlus-package

Augments the Use of 'ASReml-R' in Fitting Mixed Models

Description

Assists in automating the testing of terms in mixed models when 'asreml' is used to fit the models. The content falls into the following natural groupings: (i) Data, (ii) Object manipulation functions, (iii) Model modification functions, (iv) Model testing functions, (v) Model diagnostics functions, (vi) Prediction production and presentation functions, (vii) Response transformation functions, and (viii) Miscellaneous functions. A history of the fitting of a sequence of models is kept in a data frame. Procedures are available for choosing models that conform to the hierarchy or marginality principle and for displaying predictions for significant terms in tables and graphs. The package 'asreml' provides a computationally efficient algorithm for fitting mixed models using Residual Maximum Likelihood. It can be purchased from 'VSNi' http://www.vsni.co.uk/ as 'asreml-R', who will supply a zip file for local installation/updating.

testrcov.asrtests

Data for an experiment to investigate 25 varieties of

wheat.

Data for an experiment to investigate the quality of

water runoff over time

Forms an object of S3-class 'alldiffs' that stores the

predictions for a model fitted using asreml, along

with statistics for all pairwise differences.

Forms an object of S3-class 'asrtests' that stores a fitted asreml object, a pseudo-anova table for the fixed and a history of changes and hypthesis testing

used in obtaining the model.

Prints the values in an 'alldiffs' object in a nice format.

Prints the values in an 'asrtests' object.

Adds or removes the specified set terms from either the fixed or random model and records the change in a

data.frame.

Refits an asreml model with modified model formula using either a call to 'undate asseml' or a direct

using either a call to 'update.asreml' or a direct

call to 'asreml'.

Fits a new rcov formula using asreml.

Removes any boundary or singular variance components from the fit stored in 'asreml.obj' and records their

removal in a data.frame.

Allows the seting of constraints and initial values for terms in the 'random' and 'rcov' arguments of an

'asreml' call.

This function reparamterizes each random (deviations) term involving 'devn.fac' to a fixed term and ensures

that the same term, with 'trend.num' replacing 'devn.fac', is included if any other term with

'trend.num' is included in 'terms'.

Determines the set of significant terms taking into account hierarchy or marginality relations.

Computes AIC and BIC for a model.

Recalculates the denDF, F.inc and P values for a table of Wald test statistics obtained using 'wald.asreml'.

Performs REML likelihood ratio test.

Tests for a single fixed or random term in model

fitted using 'asreml'.

Fits a new rcov formula using 'asreml' and tests

whether the change is significant.

Tests, using a REMLRT, whether the difference between testswapran.asrtests

current random model and one in which oldterms are dropped and newterms are added is significant.

(v) Model diagnostics

variofaces.asreml Plot empirical variogram faces, including envelopes,

as described by Stefanova, Smith & Cullis (2009).

(vi) Prediction production and presentation

pred.present.asreml This function forms the predictions for each

significant term and presents them in tables and/or

graphs.

predictiondiffs.asreml Forms all pairwise differences between a set of

predictions, their standard errors and p-values for a test of whether the differences are significantly

different from zero.

predictionplot.asreml This function plots the predictions for a term,

possibly with error bars.

predictparallel.asreml This function forms the predictions and associated

statistics for a term, taking into account that a numeric vector and a factor having parallel values may occur in the model. It stores the results in an object of class 'alldifffs' and prints the results. It can be

used when there are not parallel values.

(vii) Response transformation

angular Applies the angular transformation to proportions. angular.mod

Applies the modified angular transformation to a

vector of counts.

Perform linear and power transformations on a variable power.transform

whose name is given as a character string in

'var.name'. The transformed variable is stored in the

'data.frame data'.

(viii) Miscellaneous

permute.to.zero.lowertri

num.recode Recodes the unique values of a vector using the values

in a new vector.

Permutes the rows and columns of a square matrix. permute.square

Permutes a square matrix until all the lower

triangular elements are zero.

The functions whose names end in 'asrtests', which are most of the model functions, utilize an asrtests object that stores: (i) the currently fitted model in asreml.obj, (ii) the table of test statistics for the fixed effects in wald.tab, and (iii) a data frame that contains a history of the changes made to the model in test.summary.

```

addrm.terms.asrtests Adds or removes the specified set terms from either the fixed or random model and records the change in a data.frame.

Description

The specified terms are simply added or removed from either the fixed or random model. No hypothesis testing is performed and no check is made for boundary or singular terms. A row is added to the test.summary data.frame stating whether fixed or random terms have been added or removed. Convergence in fitting the model is checked and a note included in the action if there was not. All components of the asrtests object are updated, although wald. tab is only updated if it is present in the supplied asrtests object.

addrm.terms.asrtests 7

Usage

```
addrm.terms.asrtests(terms = NULL, asrtests.obj, add = FALSE,
                     random = FALSE, label = NULL,
                     denDF = "default", trace = FALSE,
                     update = TRUE, set.terms = NULL, ignore.suffices = TRUE,
                     constraints = "P", initial.values = NA, ...)
```

Arguments

a single character string in the form of a formula which, after expansion, speciterms

fies the sum of a set of terms to be added or dropped.

asrtests.obj an asrtests object for a fitted model that is a list containing an asreml object,

a wald.tab data.frame with 4 columns, and a data.frame with 5 columns

that records any previous changes and tests in the fitted model.

add whether to add or remove terms from the model.

random whether terms are to added or removed from the fixed or random model.

a character string to use as the label in test. summary and which indicates what label

is being tested. If label is NULL, either Fixed terms or Random terms is used,

depending on whether random is TRUE or FALSE.

denDF Specifies the enthod to use in computing approximate denominator degrees of

freedom when wald.asreml is called. Can be none to suppress the computations, numeric for numerical methods, algebraic for algebraic methods or default, the default, to autommatically choose numeric or algebraic computations depending on problem size. The denominator degrees of freedom are calculated according to Kenward and Roger (1997) for fixed terms in the dense

part of the model.

if TRUE then partial iteration details are displayed when ASReml-R functions trace

are invoked; if FALSE then no output is displayed.

if TRUE then update.asreml is called in removing and adding terms to the update

> model. In doing this the arguments R. param and G. param are set to those in the asreml object stored in the supplied asrtests.obj so that the values from the previous model are used as starting values. If FALSE then calls are made to asreml in which the only changes from the previous call are (i) that the random

model is updated and (ii) modifications specified via . . . are made.

a character vector specifying the terms that are to have constraints and/or initial set.terms

values set prior to fitting.

ignore.suffices

a logical vector specifying whether the suffices of the asreml-assigned names of the variance terms (i.e. the information to the right of an "!", other than "R!") is to be ignored in matching elements of terms. If TRUE for an element of terms, the suffices are stripped from the asreml-assigned names. If FALSE for an element of terms, the element must exactly match an asreml-assigned name for a variance term. This vector must be of length one or the same length as terms. If it is of length one then the same action is applied to the asreml-

assigned suffices for all the terms in terms.

a character vector specifying the constraints to be applied to the terms specified in terms. This vector must be of length one or the same length as terms. If it is

> of length one then the same constraint is applied to all the terms in terms. If any of the constraints are equal to NA then they are left unchanged for those terms.

constraints

8 alldiffs

initial.values a character vector specifying the initial values for the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same initial value is applied to all the terms in terms. If any of the initial.values are equal to NA then they are left unchanged for those terms.

... further arguments passed to asreml and to wald.asreml.

Value

An asrtests object, which is a list containing:

- 1. asreml.obj: an asreml object containing the fit of the model after all boundary and singular terms have been removed;
- 2. wald.tab: a 4-column data.frame containing a pseudo-anova table for the fixed terms produced by wald.asreml;
- 3. test.summary: a data.frame with columns term, DF, denDF, p and action. A row is added to it for each term that is dropped, added or tested or a note that several terms have been added or removed. A row contains the name of the term, the DF, the p-value and the action taken. Possible codes are: Dropped, Retained, Swapped, Unswapped, Significant, Nonsignificant, Absent, Added, Removed and Boundary. If the changed model did not converge, Unconverged will be added to the code. Note that the logical asreml.obj\$converge also reflects whether there is convergence.

## Not run:
    terms <- "(Date/(Sources * (Type + Species)))"
    current.asrt <- addrm.terms.asrtests(terms, current.asrt, add = TRUE)

current.asrt <- addrm.terms.asrtests("A + B", current.asrt, denDF = "algebraic")

## End(Not run)</pre>
```

alldiffs

Forms an object of S3-class alldiffs that stores the predictions for a model fitted using asreml, along with supplied statistics for all pairwise differences.

Description

Creates an object of S3-class alldiffs that consists of a list containing the following components: predictions, differences, p.differences, sed, LSD and backtransforms. Predictions must be supplied to the functions while the others will be set only if they are supplies; those not supplied are set to NULL. It also has attributes response, response.title, term, classify and tdf, which will be set to the values supplied or NULL if none are supplied.

alldiffs 9

Usage

```
alldiffs(predictions, differences = NULL, p.differences = NULL,
         sed = NULL, LSD = NULL, backtransforms = NULL,
         response = NULL, response.title = NULL,
         term = NULL, classify = NULL, tdf = NULL)
```

Arguments

predictions

a data.frame containing the predicted values that is consistent with an object of class asremlPredict such as is stored in the pvals component of the prediction component of the value produced by predict.asreml. That is, in addition to variables classifying the predictions, it will include columns named predicted.value, standard.error and est.status; each row contains a single predicted value. It may also contain columns for the lower and upper confidence limits for the predictions. If LSD is not NULL, the mean LSD will be added as an attribute named meanLSD.

differences

a matrix containing all pairwise differences between the predictions; it should have the same number of rows and columns as there are rows in predictions.

p.differences

a matrix containing p-values for all pairwise differences between the predictions; each p-value is computed as the probability of a t-statistic as large as or larger than the observed difference divided by its standard error. The degrees of freedom of the t distribution for computing it are computed as the denominator degrees of freedom of the F value for the fixed term, if available; otherwise, the degrees of freedom stored in the attribute tdf are used; the matrix should be of the same size as that for differences.

sed

a matrix containing the standard errors of all pairwise differences between the predictions; they are used in computing the p-values.

LSD

a data. frame containing the mean, minimum and maximum LSD for determining the significance of pairwise differences.

backtransforms

a data.frame containing the backtransformed values of the predicted values that is consistent with an object of class asremlPredict such as is stored in the pvals component of the prediction component of the value produced by predict.asreml. That is, in addition to variables classifying the predictions, it will include columns named backtransformed.predictions and est.status; it may also contain columns for the lower and upper confidence limits; each row contains a single predicted value.

response

a character specifying the response variable for the predictions. It is stored as an attribute to the alldiffs object.

response.title a character specifying the title for the response variable for the predictions. It is stored as an attribute to the alldiffs object.

term

a character string giving the variables that define the term that was fitted using asreml and that corresponds to classify. It is often the same as classify. It is stored as an attribute to the alldiffs object.

classify

a character string giving the variables that define the margins of the multiway table used in the prediction. Multiway tables are specified by forming an interaction type term from the classifying variables, that is, separating the variable names with the : operator. It is stored as an attribute to the alldiffs object.

tdf

an integer specifying the degrees of freedom of the standard error. It is used as the degrees of freedom for the t-distribution on which p-values and confidence intervals are based. It is stored as an attribute to the alldiffs object.

10 angular

Value

An object of S3-class alldiffs with attributes response, response.title, term, classify and tdf.

See Also

asremlPlus-package, print.alldiffs, predictparallel.asreml,predictionplot.asreml, predictiondiffs.asreml, pred.present.asreml

Examples

angular

Applies the angular transformation to proportions.

Description

Applies the angular transformation to numeric values. It is given by $\sin^{-1}(\sqrt{proportions})$

Usage

```
angular(proportions, n)
```

Arguments

```
proportions The proportions.

n The divisor(s) for each proportion
```

Value

A numeric.

See Also

```
angular.mod, power.transform.
```

angular.mod 11

Examples

```
n <-25
y <- rbinom(10, n, 0.5)
y <- c(y,0,n)
p <- y/n
p.ang <- angular(p, n)</pre>
```

angular.mod

Applies the modified angular transformation to a vector of counts.

Description

Applies the angular transformation to a vector of counts. A modified transformation is used that is appropriate when N < 50 and the proportion is not between 0.3 and 0.7. The transformation is given by $\sin^{-1}\frac{count+0.375}{n+0.75}$ arcsin(sqrt((count + 0.375) / (n + 0.75))).

Usage

```
angular.mod(count, n)
```

Arguments

count

The numeric vector of counts.

n

The number(s) of observations from which the count(s) were obtained.

Value

A numeric vector.

See Also

```
angular, power.transform.
```

Examples

```
n <-25
y <- rbinom(10, n, 0.5)
y <- c(y,0,n)
p.ang.mod <- angular.mod(y, n)</pre>
```

12 asrtests

asremlPlus-deprecated Deprecated Functions in Package asremlPlus

Description

These functions have been renamed and deprecated in asremlPlus: addrm.terms.asreml replaced by addrm.terms.asrtests, choose.model.asreml by choose.model.asrtests, recalc.wald.tab.asreml by recalc.wald.tab.asrtests, rmboundary.asreml by rmboundary.asrtests, sig.devn.reparam.asreml by sig.devn.reparam.asrtests, testranfix.asreml by testranfix.asrtests, testrov.asreml by testrov.asrtests, testswapran.asreml by testswapran.asrtests, info.crit by info.crit.asreml, reml.lrt by reml.lrt.asreml

Usage

```
addrm.terms.asreml(...)
choose.model.asreml(...)
recalc.wald.tab.asreml(...)
rmboundary.asreml(...)
sig.devn.reparam.asreml(...)
testranfix.asreml(...)
testrcov.asreml(...)
testswapran.asreml(...)
info.crit(...)
reml.lrt(...)
```

Arguments

... absorbs arguments passed from the old functions of the style foo.bar().

Author(s)

Chris Brien

asrtests

Forms an object of S3-class asrtests that stores a fitted asreml object, a pseudo-anova table for the fixed and a history of changes and hypthesis testing used in obtaining the model.

Description

An object of S3-class asrtests consists of a list containing:

- 1. asreml.obj: an asreml object containing the fit of the model;
- 2. wald.tab: a data.frame containing a pseudo-anova table for the fixed terms produced by wald.asreml, which will be called if wald.tab is NULL;

asrtests 13

3. test.summary: a data.frame with columns term, DF, denDF, p and action. A row is added to it for each term that is dropped, added or tested or a note that several terms have been added or removed. A row contains the name of the term, the DF, the p-value and the action taken. Possible codes are: Dropped, Retained, Swapped, Unswapped, Significant, Nonsignificant, Absent, Added, Removed and Boundary. If the changed model did not converge, Unconverged will be added to the code. Note that the logical asreml.obj\$converge also reflects whether there is convergence.

A call to asrtests with test.summary = NULL re-initializes the test.summary data.frame.

Usage

Arguments

asreml.obj an asreml object for a fitted model.

wald.tab a data.frame containing a pseudo-anova table for the fixed terms produced by

wald.asreml; it should have 4 columns. Sometimes wald.asreml returns a data.frame and at other times a list. For example, it may return a list when denDF is used. In this case, the Wald component of the list is to be extracted

and stored.

test.summary a data.frame with columns term, DF, denDF, p and action containing the re-

sults of previous hypothesis tests.

denDF Specifies the enthod to use in computing approximate denominator degrees of

freedom when wald.asreml is called. Can be none to suppress the computations, numeric for numerical methods, algebraic for algebraic methods or default, the default, to autommatically choose numeric or algebraic computations depending on problem size. The denominator degrees of freedom are calculated according to Kenward and Roger (1997) for fixed terms in the dense

part of the model.

... further arguments passed to wald.asreml.

Value

An object of S3-class asrtests.

See Also

asremlPlus-package, testranfix.asrtests, choose.model.asrtests, rmboundary.asrtests, sig.devn.reparam.asrtests

Examples

14 choose.model.asrtests

```
data=Wheat.dat)

# Load current fit into an asrtests object
current.asrt <- asrtests(current.asr, NULL, NULL)

# Check for and remove any boundary terms
current.asrt <- rmboundary.asrtests(current.asrt)

## End(Not run)</pre>
```

choose.model.asrtests Determines the set of significant terms taking into account the hierarchy or marginality relations.

Description

Performs a series of hypothesis tests taking into account the marginality of terms. In particular, a term will not be tested if it is marginal to (or nested in) one that is significant. For example, if A:B is significant, then neither A nor B will be tested. For a random term, the term is removed from the model fit, any boundary terms are removed using rmboundary.asrtests and a REML likelihood ratio test is performed using reml.lrt.asreml. If it is not significant and drop.ran.ns is TRUE, the term is permanently removed from the model. Note that if boundary terms are removed, the reduced model may not be nested in the full model in which case the test is not valid. For fixed terms, the Wald tests are performed and the p-value for the term obtained. If it is not significant and drop.fix.ns is TRUE, the term is permanently removed from the model. A row is added to test.summary for each term that is tested.

Usage

Arguments

terms.marginality

a square matrix of ones and zeros with row and column names being the names of the terms. The diagonal elements should be one, indicating that a term is marginal to itself. Elements should be one if the row term is marginal to the column term. All other elements should be zero.

asrtests.obj

an asrtests object for a fitted model that is a list containing an asreml object, a wald.tab data.frame with 4 columns, and a data.frame with 5 columns that records any previous changes and tests in the fitted model.

alpha the sig

the significance level for the test.

drop.ran.ns

a logical indicating whether to drop nonsignificant random terms from the model.

choose.model.asrtests 15

positive.zero

Indicates whether the hypothesized values for the variance components being tested are on the boundary of the parameter space. For example, this is true for positively-constrained variance components that, under the reduced model, are zero. This argument does not need to be set if bound.test.parameters is set.

bound.test.parameters

Indicates whether for the variance components being tested, at least some of the hypothesized values are on the boundary of the parameter space. The default is "none". Other possibilities are "onlybound" and "one-and-one". The latter signifies that there are two parameters being tested, one of which is bound and the other is not. For example, the latter is true for testing a covariance and a positively-constrained variance component that, under the reduced model, are zero.

drop.fix.ns

a logical indicating whether to drop a fixed term from the model when it is nonsignificant

denDF

Specifies the enthod to use in computing approximate denominator degrees of freedom when wald.asreml is called. Can be none to suppress the computations, numeric for numerical methods, algebraic for algebraic methods or default, the default, to autommatically choose numeric or algebraic computations depending on problem size. The denominator degrees of freedom are calculated according to Kenward and Roger (1997) for fixed terms in the dense part of the model.

dDF.na

the method to use to obtain substitute denominator degrees of freedom. when the numeric or algebraic methods produce an NA. If dDF.na = "none", no subtitute denominator degrees of freedom are employed; if dDF.na = "residual", the residual degrees of freedom from asreml.obj\$nedf are used; if dDF.na = "maximum", the maximum of those denDF that are available, excluding that for the Intercept, is used; if all denDF are NA, asreml.obj\$nedf is used. If dDF.na = "supplied", a vector of values for the denominator degrees of freedom is to be supplied in dDF.values. Any other setting is ignored and a warning message produced. Generally, substituting these degrees of freedom is anticonservative in that it is likely that the degrees of freedom used will be too large.

dDF.values

A vector of values to be used when dDF.na = "supplied". Its values will be used when denDF in a test for a fixed effect is NA. This vector must be the same length as the number of fixed terms, including (Intercept) whose value could be NA.

trace

if TRUE then partial iteration details are displayed when ASReml-R functions are invoked; if FALSE then no output is displayed.

update

if TRUE then update.asreml is called in testing models. In doing this the arguments R.param and G.param are set to those in the asreml object stored in asrtests.obj so that the values from the previous model are used as starting values. If FALSE then a call is made to asreml in which the only changes to the asreml.obj stored in the supplied asrtests.obj are (i) to the terms in the fixed and random models corresponding to terms in terms.marginality and (ii) those modifications specified via

set.terms

a character vector specifying the terms that are to have constraints and/or initial values set prior to fitting.

ignore.suffices

a logical vector specifying whether the suffices of the asreml-assigned names of the variance terms (i.e. the information to the right of an "!", other than "R!") is to be ignored in matching elements of terms. If TRUE for an element

16 choose.model.asrtests

> of terms, the suffices are stripped from the asreml-assigned names. If FALSE for an element of terms, the element must exactly match an asreml-assigned name for a variance term. This vector must be of length one or the same length as terms. If it is of length one then the same action is applied to the asremlassigned suffices for all the terms in terms.

constraints

a character vector specifying the constraints to be applied to the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same constraint is applied to all the terms in terms. If any of the constraints are equal to NA then they are left unchanged for those terms.

initial.values a character vector specifying the initial values for the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same initial value is applied to all the terms in terms. If any of the initial.values are equal to NA then they are left unchanged for those terms.

further arguments passed to asreml and wald.asreml via testranfix.asrtests.

Value

A list containing:

- 1. asrtests.obj: an asrtests object, containing the asreml object corresponding to the final fit, a wald.tab data.frame, and a test.summary data.frame that contains a record of the testing of the terms (see asrtests for more details);
- 2. sig.tests: a character vector whose elements are the the significant terms amongst those tested.

```

info.crit.asreml 17

info.crit.asreml

Computes AIC and BIC for a model.

Description

Computes Akiake and Bayesian (Schwarz) Information Criteria for a model. The function info.crit is provided for backwards compatibility.

Usage

```
info.crit.asreml(asreml.obj)
```

Arguments

asreml.obj

An asreml object resulting from the fitting of a model using REML.

Value

A data frame containing the Residual degrees of freedom, AIC, BIC and log of the REML value.

See Also

```
reml.lrt.asreml
```

Examples

newfit.asreml

refits an asreml model with modified model formula using either a call to update.asreml or a direct call to asreml.

Description

Extracts the call from the asreml.obj and evaluates that call, replacing any arguments with changed values. If update is TRUE and set.terms is not set, the call is evaluated using update.asreml; otherwise, it is evaluated using a direct call to asreml. The principal difference is that the latter does not enforce the use of previous values of the variance parameters as initial values; it sets G.param and R.param to NULL or to values as specified for set.terms. The ... argument can be used to pass G.param and/or R.param, provided update is FALSE and set.terms is not set.

18 newfit.asreml

Usage

Arguments

asreml.obj a valid asreml object with with a component named call (from a previous call

to either asreml or update.asreml).

fixed. a character or formula specifying changes to the fixed formula. This is a two-

sided formula where "." is substituted for existing components in the fixed com-

ponent of asreml.obj\$call.

random. a character or formula specifying changes to the random formula. This is a one-

sided formula where "." is substituted for existing components in the random

component of asreml.obj\$call.

sparse. a character or formula specifying changes to the sparse formula. This is a one-

sided formula where "." is substituted for existing components in the sparse

component of asreml.obj\$call.

rcov. a character or formula specifying changes to the error formula. This is a one-

sided formula where "." is substituted for existing components in the rcov com-

ponent of asreml.obj\$call.

update a logical indicated whether to use update.asreml or asreml to evaluate the

modified call. If TRUE, use update.asreml to evaluate the modified call. In doing this the arguments R.param and G.param are set to those in the asreml.obj so that the values from the previous model are used as starting values. If FALSE then a call is made to asreml itself, in which the only changes from the previous

call are those specified in the arguments to newfit.asreml.

keep.order a logical value indicating whether the terms should keep their positions. If FALSE

the terms are reordered so that main effects come first, followed by the interactions, all second-order, all third-order and so on. Effects of a given order are

kept in the order specified.

set.terms a character vector specifying the terms that are to have constraints and/or initial

values set prior to fitting.

ignore.suffices

a logical vector specifying whether the suffices of the asreml-assigned names of the variance terms (i.e. the information to the right of an "!", other than "R!") is to be ignored in matching elements of terms. If TRUE for an element of terms, the suffices are stripped from the asreml-assigned names. If FALSE

for an element of terms, the element must exactly match an asreml-assigned name for a variance term. This vector must be of length one or the same length as terms. If it is of length one then the same action is applied to the asreml-

assigned suffices for all the terms in terms.

constraints a character vector specifying the constraints to be applied to the terms specified in terms. This vector must be of length one or the same length as terms. If it is

of length one then the same constraint is applied to all the terms in terms. If any of the constraints are equal to NA then they are left unchanged for those terms.

initial.values a character vector specifying the initial values for the terms specified in terms.

This vector must be of length one or the same length as terms. If it is of length one then the same initial value is applied to all the terms in terms. If any of the initial values are equal to NA then they are left unchanged for those terms.

newrcov.asrtests 19

... additional arguments to the call, or arguments with changed values.

Value

An asreml object.

## End(Not run)</pre>
```

newrcov.asrtests

Fits a new rcov formula using asreml.

Description

Fits a new rcov formula using asreml. Any boundary terms resulting after fitting the new rcov model are removed using rmboundary.asrtests. A row is added to the test.summary data.frame using the supplied label and the action Set.

Usage

Arguments

terms a model for the rcov argument in asrem1, stored as a character.

asrtests.obj an asrtests object for a fitted model that is a list containing an asreml object,

a wald.tab data.frame with 4 columns, and a data.frame with 5 columns

that records any previous changes and tests in the fitted model.

label a character string to use as the label in test. summary and which indicates what

is being tested.

update if TRUE then update.asreml is called to fit the model with the rcov model

supplied in terms. In doing this the arguments R.param and G.param are set to those in the asreml object stored in asrtests.obj so that the values from the previous model are used as starting values. If FALSE then a call is made to asreml in which the only changes from the previous call are that (i) rcov model is that specified in terms and (ii) modifications specified via . . . are made.

20 newrcov.asrtests

trace if TRUE then partial iteration details are displayed when ASReml-R functions

are invoked; if FALSE then no output is displayed.

Specifies the method to use in computing approximate denominator degrees of freedom when wald.asreml is called. Can be none to suppress the computations, numeric for numerical methods, algebraic for algebraic methods or default, the default, to autommatically choose numeric or algebraic computations depending on problem size. The denominator degrees of freedom are calculated according to Kenward and Roger (1997) for fixed terms in the dense

part of the model.

a character vector specifying the terms that are to have constraints and/or initial set.terms

values set prior to fitting.

ignore.suffices

denDF

a logical vector specifying whether the suffices of the asreml-assigned names of the variance terms (i.e. the information to the right of an "!", other than "R!") is to be ignored in matching elements of terms. If TRUE for an element of terms, the suffices are stripped from the asreml-assigned names. If FALSE for an element of terms, the element must exactly match an asreml-assigned name for a variance term. This vector must be of length one or the same length as terms. If it is of length one then the same action is applied to the asremlassigned suffices for all the terms in terms.

constraints

a character vector specifying the constraints to be applied to the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same constraint is applied to all the terms in terms. If any of the constraints are equal to NA then they are left unchanged for those terms.

initial.values a character vector specifying the initial values for the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same initial value is applied to all the terms in terms. If any of the initial.values are equal to NA then they are left unchanged for those terms.

further arguments passed to asreml and to wald.asreml.

Value

An asrtests object, which is a list containing:

- 1. asreml.obj: an asreml object containing the fit after the term has been omitted from the model;
- 2. wald.tab: a 4-column data.frame containing a pseudo-anova table for the fixed terms produced by wald.asreml;
- 3. test.summary: a data.frame with columns term, DF, denDF, p and action. A row is added to it for each term that is dropped, added or tested or a note that several terms have been added or removed. A row contains the name of the term, the DF, the p-value and the action taken. Possible codes are: Dropped, Retained, Swapped, Unswapped, Significant, Nonsignificant, Absent, Added, Removed and Boundary. If the changed model did not converge, Unconverged will be added to the code. Note that the logical asreml.obj\$converge also reflects whether there is convergence.

If the term is not in the model, then the supplied asreml object will be returned. Also, reml.test will have the likelihood ratio and the p-value set to NA and the degrees of freedom to zero. Similarly, the row of test.summary for the term will have its name, a p-value set to NA, and action set to Absent.

Examples

num.recode

Recodes the unique values of a vector using the values in a new vector.

Description

Recodes the unique values of a variate using the value in position i of the new values vector to replace the ith sorted unique values of x. The new levels do not have to be unique.

Usage

```
num.recode(x, new.values)
```

Arguments

x The vector to be recoded.

new.values A vector of length unique(x) containing values to use in the recoding.

Value

A vector.

```

permute.square

Permutes the rows and columns of a square matrix.

Description

Permutes the rows and columns of a square matrix.

Usage

```
permute.square(x, permutation)
```

Arguments

x A square matrix.

permutation A vector specifying the new order of rows and columns.

Value

A square matrix.

See Also

```
permute.to.zero.lowertri
```

Examples

```
permute.to.zero.lowertri
```

Permutes a square matrix until all the lower triangular elements are zero.

Description

Permutes a square matrix until all the lower triangular elements are zero.

Usage

```
permute.to.zero.lowertri(x)
```

plotvariofaces.asreml 23

Arguments

Х

A square matrix of order n with at least n*(n-1)/2 zero elements.

Value

A square matrix.

See Also

```
permute.square
```

Examples

plotvariofaces.asreml plot empirical variogram faces, including envelopes, from supplied residuals as described by Stefanova, Smith & Cullis (2009)

Description

Produces a plot for each face of an empirical 2D variogram based on supplied residuals from both an observed data set and simulated data sets. Those from simulated data sets are used to produce confidence envelopes If the data consists of sections, such as separate experiments, the two variogram faces are produced for each section. This function is less efficient in storage terms than variofaces.asreml, because here the residuals from all simulated data sets must be saved, in addition to the values for the variogram faces; in variofaces.asreml, the residuals for each simulated data set are discarded after the variogram has been calculated. On the other hand, the present function is more flexible, because there is no restriction on how the residuals are obtained.

Usage

```
plotvariofaces.asreml(data, residuals, restype="Residuals", ...)
```

Arguments

data	A data.frame with either 3 or 4 columns. Only if there are 4 columns, the first should be a factor indexing sections for which separate variogram plots are to be produced. In either case, the other 3 columns should be, in order, (i) a factor indexing the x-direction, (ii) a factor indexing the y-direction, and (iii) the residuals for the observed response.
residuals	A data.frame, with with either 2 or 3 initial columns followed by columns, each of which are the residuals from a simulated data set.
restype	A character describing the type of residuals that have been supplied. It will be used in the plot titles.
	Other arguments that are passed down to the function asreml.variogram.

24 plotvariofaces.asreml

Details

For each set of residuals, asreml.variogram is used to obtain the empirical variogram, from which the values for its faces are obtained. Plots are produced for each face and include the observed residuals and the 2.5%, 50% & 97.5% quantiles.

Value

A list with the following components:

- face1: a data. frame containing the variogram values on which the plot for the first dimension is based.
- face2: a data.frame containing the variogram values on which the plot for the second dimension is based.

power.transform 25

residuals=resid\$residuals,
restype="Standardized conditional residuals")

End(Not run)

power.transform

Perform a combination of a linear and power transformation on a variable whose name is given as a character string in var.name. The transformed variable is stored in the data. frame data.

Description

Perform a combination of a linear and a power transformation on a variable whose name is given as a character string in var.name. The transformed variable is stored in the data. frame data. The name of the transformed variable is made by prepending to the original var.name a combination of (i).offset, if offset is nonzero, (ii) neg., if scale is -1, or scaled., if abs(scale) is other than one, and (iii) either log., sqrt., recip. or power., if power is other than one. No action is taken if there is no transformation (i.e. offset = 0, scale = 1 and power = 1). Also, the titles list is extended to include a component with a generated title for the transformed variable with text indicating the transformation prepended to the title for the var.name obtained from the titles list. For nonzero offset, 'Offset' is prepended, For scaled not equal to one, the possible prepends are 'Negative of' and 'Scaled'. The possible prepended texts for power not equal to one are 'Logarithm of', 'Square root of', 'Reciprocal of' and 'Power nnnn of', where nnn is the power used.

Usage

```
power.transform(var.name, power = 1, offset = 0, scale = 1, titles = NULL, data)
```

Arguments

var.name	A character string specifying the name of the variable in the data. frame data that is to be transformed.
power	A number specifying the power to be used in the transformation. If equal to 1, the default, no power transformation is applied. Otherwise, the variable is raised to the specified power, after scaling and applying any nonzero offset. If power = 0, the natural logarithm is used to transform the response; however, if the smallest value to be log-transformed is less than 1e-04, an error is generated. A log-transformation in this situation may be possible if a nonzero offset and/or a scale not equal to one is used.
offset	A number to be added to each value of the variable, after any scaling and before applying any power transformation.
scale	A number to multiply each value of the variable, before adding any offset and applying any power transformation.
titles	A character vector, each element of which is named for a variable in data and is a character string giving a title to use in output (e.g. tables and graphs) involving the variable. If titles are not supplied, the column name of the variable in dta is used.
data	A data. frame containing the variable to be transformed and to which the transformed variable is to be appended.

Value

A list with a component named data that is the data.frame containing the transformed variable, a component named tvar.name that is a character string that is the name of the transformed variable in data, and a component named titles that extends the list supplied in the titles argument to include a generated title for the transformed title, the name of the new component being tvar.name.

Examples

pred.present.asreml

This function forms the predictions for each significant term and presents them in tables and/or graphs.

Description

This function forms the predictions for each term in terms using a supplied asreml object and predictparallel.asreml. Tables are produced using predictparallel.asreml, in conjunction with predictiondiffs.asreml, with the argument tables specifying which tables are printed. The argument plots, along with transform.power, controls which plots are produced. The plots are produced using predictionplot.asreml, with line plots produced when variables involving x.num or x.fac are involved in classify for the predictions and bar charts otherwise. In order to get the correct predictions you may need to supply additional arguments to predict through ... e.g. present.

Usage

```
pred.present.asreml(terms, asreml.obj = NULL,
                    wald.tab = NULL, dDF.na = "residual", dDF.values = NULL,
                    x.num = NULL, x.fac = NULL, nonx.fac.order = NULL,
                    x.pred.values = NULL, x.plot.values = NULL,
                    plots = "predictions", panels = "multiple",
                    graphics.device = NULL,
                    error.intervals = "Confidence", avsed.tolerance = 0.25,
                   titles = NULL, colour.scheme = "colour", save.plots = FALSE,
                    transform.power = 1, offset = 0, scale = 1,
                    pairwise = TRUE, tables = "all", levels.length = NA,
                    alpha = 0.05, inestimable.rm = TRUE,
                    trace = FALSE, ggplotFuncs = NULL, ...)
```

Arguments

terms a character vector giving the terms for which predictions are required.

asreml.obj asreml object for a fitted model.

wald.tab a data frame containing the pseudo-anova table for the fixed terms produced by a call to wald.asreml. The main use of it here is in getting denominator

degrees of freedom when confidence intervals are to be plotted.

the method to use to obtain approximate denominator degrees of freedom. when the numeric or algebraic methods produce an NA. Consistent with when no denDF are available, the default is "residual" and so the residual degrees of freedom from asreml.obj\$nedf are used. If dDF.na = "none", no subtitute denominator degrees of freedom are employed; if dDF.na = "maximum", the maximum of those denDF that are available, excluding that for the Intercept, is used; if all denDF are NA, asreml.obj\$nedf is used. If dDF.na = "supplied", a vector of values for the denominator degrees of freedom is to be supplied in dDF. values. Any other setting is ignored and a warning message produced.

likely that the degrees of freedom used will be too large.

A vector of values to be used when dDF.na = "supplied". Its values will be used when denDF in a test for a fixed effect is NA. This vector must be the same length as the number of fixed terms, including (Intercept) whose value could be

NA.

A character string giving the name of the numeric covariate that corresponds to x.fac, is potentially included in terms in the fitted model and which corresponds to the x-axis variable. It should have the same number of unique values as the

Generally, substituting these degrees of freedom is anticonservative in that it is

number of levels in x. fac.

A character string giving the name of the factor that corresponds to x.num, is potentially included in terms in the fitted model and which corresponds to the xaxis variable. It should have the same number of levels as the number of unique values in x. num. The levels of x. fac must be in the order in which they are to be plotted - if they are dates, then they should be in the form yyyymmdd which

can be achieved using as.Date.

A character vector giving the order in which factors other than x. fac are to be plotted in plots with multiple panels (i.e. where the number of non-x factors is greater than 1). The first factor in the vector will be plotted on the X axis (if there is no x. num or x. fac. Otherwise, the order of plotting the factors is in columns

dDF.na

dDF.values

x.num

x.fac

nonx.fac.order

(X facets) and then rows (Y facets). By default the order is in decreasing order for the numbers of levels of the non x factors.

x.pred.values

The values of x. num for which predicted values are required.

x.plot.values

The actual values to be plotted on the x axis or in the labels of tables. They are needed when values different to those in x.num are to be plotted or x.fac is to be plotted because there is no x.num term corresponding to the same term with x.fac.

plots

Possible values are "none", "predictions", "backtransforms" and "both". Plots are not produced if the value is "none". If data are not transformed for analysis (transform.power = 1), a plot of the predictions is produced provided plots is not "none". If the data are transformed, the value of plots determines what is produced.

panels

Possible values are "single" and "multiple". When line plots are to be produced, because variables involving x.num or x.fac are involved in classify for the predictions, panels determines whether or not a single panel or multiple panels in a single window are produced. The panels argument is ignored for for bar charts.

graphics.device

A character specifying a graphics device for plotting. The default is graphics.device = NULL, which will result in plots being produced on the current graphics device. Setting it to "windows", for example, will result in a windows graphics device being opened.

error.intervals

A character string indicating the type of error interval, if any, to calculate and plot in order to indicate uncertainty in the results. Possible values are "none", "StandardError", "Confidence" and "halfLeastSignificant". The default is for confidence limits to be used. The "halfLeastSignificant" option results in half the Least Significant Difference (LSD) being added and subtracted to the predictions, the LSD being calculated using the average of the standard errors of all pairwise differences (SEDs) between the predictions. However, if the range of the SEDs divided by the average of the SEDs exceeds avsed. tolerance, calculations and plotting will revert to confidence intervals. Also, half LSDs cannot be used for backtansformed values and so confidence intervals will be used instead.

avsed.tolerance

The values of the range of the SEDs divided by the average of the SEDs that, if exceeded, will cause calculations and plotting to revert to confidence intervals. It should be a value between 0 and 1.

titles

A list, each component of which is named for an object name and contains a character string giving a title to use in output (e.g. tables and graphs) for the object. Here they will be used for axis labels.

colour.scheme

A character string specifying the colour scheme for the plots. The default is "colour" which produces coloured lines and bars, a grey background and white gridlines. A value of "black" results in black lines, grey bars and gridlines and a white background.

save.plots

A logical that determines whether any plots will be saved. If they are to be saved, a file name will be generated that consists of the following elements separated by full stops: the response variable name with .back if backtransformed values are being plotted, the classify term, Bar or Line and, if error.intervals is not "none", one of SE, CI or LSI. The file will be saved as a 'png' file in the current work directory.

transform.power

A number specifying the power of a transformation, if one has been applied to the response variable. Unless it is equal to 1, the default, back-transforms of the predictions will be obtained and presented in tables or graphs as appropriate. The back-transform will raise the predictions to the power equal to the reciprocal of transform.power, unless it equals 0 in which case the exponential will be taken. Any scaling and offsetting will also be taken into account in the backtransformation.

offset

A number that has been added to each value of the response after any scaling and before applying any power transformation. Unless it is equal to 0, the default, back-transforms of the predictions will be obtained and presented in tables or graphs as appropriate. The back-transform will, after backtransforming for any power transformation and scaling for any scale transformation, subtract the offset.

scale

A number by which each value of the response has been multiply before adding any offset and applying any power transformation. Unless it is equal to 1, the default, back-transforms of the predictions will be obtained and presented in tables or graphs as appropriate. The back-transform will, after backtransforming for any power transformation, divide by the scale.

pairwise

A logical indicating whether all pairise differences of the predictions and their standard errors and p-values are to be computed and stored. If tables is equal to "differences" or "all" or error.intervals is equal to "halfLeastSignificant", they will be stored irrespective of the value of pairwise.

tables

levels.length

The elements of the alldiffs object to print. Possible values are "none", "predictions", "backtransforms", "nodifferences", "differences" and "all". The option "nodifferences" will result in "predictions" and "backtransforms" being printed. The option "differences" will also result in the printing of the

predictions from the alldiffs object.

The maximum number of characters from the levels of factors to use in the row and column labels of the tables produced by predictiondiffs.asreml.

alpha the significance level for the test or 1 - alpha is the confidence level for confi-

dence intervals.

inestimable.rm A logical indicating whether rows for predictions that are not estimable are to

be removed from the components of the alldiffs object.

trace if TRUE then partial iteration details are displayed when ASReml-R functions

are invoked; if FALSE then no output is displayed.

ggplotFuncs A list, each element of which contains the results of evaluating a ggplot func-

tion. It is created by calling the list function with a ggplot function call for

each element. It is passed to predictionplot.asreml.

... further arguments passed to predict.asreml via predictparallel.asreml

and to ggplot via predictionplot.asreml.

Value

a list containing a alldiffs object for each term for which tables are produced. The names of the components of this list are the terms with full-stops (.) replacing colons (:).

                                  present = c("Type", "Species", "Sources"),
                                  tables = "differences", levels.length = 6)
## End(Not run)
```

predictiondiffs.asreml

Uses information in a supplied alldiffs object to forms all pairwise differences between a set of predictions, the p-values for a test of whether the differences are significantly different from zero, and the minimum, mean and maximum LSD values, provided they are not present in the supplied alldiffs object.

Description

Uses predictions and standard errors of pairwise differences from an alldiffs object to form, for those components not already present, (i) a table of all pairwise differences of the predictions in an alldiffs object, (ii) the p-values of each pairwise difference, and (iii) the minimum, mean and maximum LSD values. Predictions that are aliased (or nonestimable) are removed from the predictions component of the alldiffs object and standard errors of differences involving them are removed from the sed component.

Each p-value is computed as the probability of a t-statistic as large as or larger than the absolute value of the observed difference divided by its standard error. The p-values are stored in the p.differences component. The degrees of freedom of the t-distribution is the degrees of freedom stored in the tdf attribute of the alldiffs object. This t-distibution is also used in calculating the LSD statistics stored in the alldiffs object.

Usage

predictiondiffs.asreml 31

```
levels.length = NA,
pairwise = TRUE, alpha = 0.05,
inestimable.rm = TRUE)
```

Arguments

classify a character string giving the variables that define the margins of the multiway

table to be predicted. Multiway tables are specified by forming an interaction type term from the classifying variables, that is, separating the variable names

with the : operator.

alldiffs.obj An alldiffs object for a fitted model. Note that the attribute tdf, being the de-

grees of freedom for the critical t-value to be used incomputing p-values, should

be set to an appropriate value.

x.num A character string giving the name of the numeric covariate that corresponds to

x.fac, is potentially included in terms in the fitted model and which corresponds to the x-axis variable. It should have the same number of unique values as the

number of levels in x. fac.

x.fac A character string giving the name of the factor that corresponds to x.num, is

potentially included in terms in the fitted model and which corresponds to the x-axis variable. It should have the same number of levels as the number of unique values in x. num. The levels of x. fac must be in the order in which they are to be plotted - if they are dates, then they should be in the form yyyymmdd which

can be achieved using as.Date.

levels.length The maximum number of characters from the levels of factors to use in the

row and column labels of the tables of pairwise differences and their p-values

and standard errors.

pairwise A logical indicating whether all pairwise differences of the predictions and

their standard errors and p-values are to be computed and stored. If FALSE, the components differences and p.differences will be NULL in the returned

alldiffs object.

alpha The significance level for an LSD to compare a pair of predictions.

inestimable.rm A logical indicating whether rows for predictions that are not estimable are to

be removed from the components of the alldiffs object.

Value

An alldiffs object that is a list with components predictions containing the predictions and their standard errors, differences containing all pairwise differences between the predictions, p. differences containing p-values for all pairwise differences between the predictions, sed containing the standard errors of all pairwise differences between the predictions, and, an LSD containing the mean, minimum and maximum LSDs.

```

32 predictionplot.asreml

predictionplot.asreml This function plots the predictions for a term, possibly with error bars.

Description

This function plots the predictions y that are based on classify stored in the data. frame data. The package ggplot2 is used to produce the plots. Line plots are produced when variables involving x.num or x.fac are involved in classify for the predictions; otherwise, bar charts are produced. Further, for line charts, the argument panels determines whether a single plot or multiple plots in a single window are produced; for bar charts, the argument panels is ignored.

Usage

Arguments

classify

a character string giving the combinations of the independent variables on which the predictions are based. It is an interaction type term formed from the independent variables, that is, separating the variable names with the : operator.

У

a character string giving the name of the variable that is to be plotted on the Y

data

a data.frame containing the values of the variables to be plotted. It should be consistent with an object of class asremlPredict such as is stored in the pvals component of the predictions component of the value produced by predict.asreml; that is, in addition to variables classifying the predictions, it will include a column with the name specified in the y argument, usually predicted.value or backtransformed.predictions; each row contains a single predicted value. If error.intervals is not "none", then the predictions component and, if present, the backtransforms component should contain columns for the lower and upper values of the limits for the interval with names that begin with lower and upper, respectively. The second part of the name must be one of Confidence, StandardError or halfLeastSignificant. The last part needs to be consistent between the lower and upper limits.

x.num

A character string giving the name of the numeric covariate that corresponds to x. fac, is potentially included in terms in the fitted model and which corresponds to the x-axis variable. It should have the same number of unique values as the number of levels in x.fac.

x.fac

A character string giving the name of the factor that corresponds to x.num, is potentially included in terms in the fitted model and which corresponds to the xaxis variable. It should have the same number of levels as the number of unique values in x. num. The levels of x. fac must be in the order in which they are to be plotted - if they are dates, then they should be in the form yyyymmdd which can be achieved using as. Date.

nonx.fac.order A character vector giving the order in which factors other than x.fac are to be plotted in facetted plots (i.e. where the number of non x factors is greater than 1). The first factor in the vector will be plotted on the X axis (if there is no x.num or x.fac. Otherwise, the order of plotting the factors is in columns (X facets) and then rows (Y facets). By default the order is in decreasing order for the numbers of levels of the non x factors.

colour.scheme

A character string specifying the colour scheme for the plots. The default is "colour" which produces coloured lines and bars, a grey background and white gridlines. A value of "black" results in black lines, grey bars and gridlines and a white background.

panels

Possible values are "single" and "multiple". When line plots are to be produced, because variables involving x.num or x.fac are involved in classify for the predictions, panels determines whether or not a single panel or multiple panels in a single window are produced. The panels argument is ignored for bar charts.

graphics.device

A character specifying a graphics device for plotting. The default is graphics.device = NULL, which will result in plots being produced on the current graphics device. Setting it to "windows", for example, will result in a windows graphics device being opened.

error.intervals

A character string indicating the type of error interval, if any, to calculate and plot in order to indicate uncertainty in the results. Possible values are "none", "StandardError", "Confidence" and "halfLeastSignificant". Here, any option other than "none" will result in the interval limits contained in data being plotted.

titles

A list, each component of which is named for an object name and contains a character string giving a title to use in output (e.g. tables and graphs) for the object. Here they will be used for axis labels for nonresponse variables. For response variable labels see y.title.

filestem

A character sting giving the beginning of the name of the file in which to save the plot. If filestem = NULL, the plot is not saved. The remainder of the file name will be generated automatically and consists of the following elements separated by full stops: the classify term, Bar or Line and, if error.intervals is not "none", one of SE, CI or LSI. The file will be saved as a 'png' file in the current work directory.

y.title

The title to be displayed on the y axis of any plot.

ggplotFuncs

A list, each element of which contains the results of evaluating a ggplot function. It is created by calling the list function with a ggplot function call for each element.

further arguments passed to ggplot.

34 predictparallel.asreml

Value

no values are returned.

## End(Not run)
```

predictparallel.asreml

Uses an asreml object and a wald.tab to form the predictions and associated statistics for a term. It stores the results in an object of class alldiffs and may print the results. It can be used when a numeric vector and a factor that have parallel values both occur in the model and need to be taken into account.

Description

This function forms the predictions for term using classify and the supplied asreml object and stores them in an alldiffs object. If x.num is supplied, the predictions will be obtained for the values supplied in x.pred.values and, if supplied, x.plot.values will replace them in the alldiffs object that is returned. If x.fac, but not x.num, is specified, predictions will involve it and, if supplied, x.plot.values will replace the levels of x.fac in the alldiffs object that is returned. In order to get the correct predictions you may need to supply additional arguments to predict through ... e.g. present. Any aliased predictions will be removed, as will any standard error of pairwise differences involving them.

35

Also calculated are the approximate degrees of freedom of the standard errors of the predictions. If the deominator degrees of freedom for term are available in wald. tab, they are used. Otherwise the residual degrees of freedom or the maximum of the denominator degrees in wald. tab, excluding the Intercept, are used. Which is used depends on the setting of dDF.na. These degrees of freedom are used for the t-distribution on which p-values and confidence intervals are based. It is stored as an attribute to the alldiffs object. The degrees of freedom are also used in valculating the minimum, mean and maximum LSD fro comparing pairs of predictions, which are also stored in the alldiffs object.

If pairwise = TRUE, all pairwise differences between the predictions, their standard errors, p-values and LSD statistics are computed using predictiondiffs.asreml. This adds them to the alldiffs object as additional list components named differences, sed, p.differences and LSD.

If a transformation has been applied (any one of transform.power is not one, scale is not one and offset is nonzero), the back-transforms of the predicted values and their lower and upper confidence intervals are added to a data.frame that is consistent with an object of class asremlPredict, such as is stored in the pvals component of the prediction component of the value produced by predict.asreml. This data.frame is added to the alldiffs object as a list component called backtransforms.

The printing of the components produced is controlled by the tables argument.

Usage

Arguments

classify a character string giving the variables that define the margins of the multiway table to be predicted. Multiway tables are specified by forming an interaction

type term from the classifying variables, that is, separating the variable names

with the : operator.

term a character string giving the variables that define the term that was fitted using

asreml and that corresponds to classify. It only needs to be specified when it

is different to classify.

asreml.obj asreml object for a fitted model.

36 predictparallel.asreml

titles A list, each component of which is named for an object name and contains a character string giving a title to use in output (e.g. tables and graphs) for

the object. Here they will be used for table headings.

x.num A character string giving the name of the numeric covariate that (i) corresponds to x.fac, (ii)is potentially included in terms in the fitted model, and (iii) which

corresponds to the x-axis variable. It should have the same number of unique

values as the number of levels in x.fac.

A character string giving the name of the factor that (i) corresponds to x. num, (ii) is potentially included in terms in the fitted model, and (iii) which corresponds to the x-axis variable. It should have the same number of levels as the number of unique values in x.num. The levels of x.fac must be in the order in which they are to be plotted - if they are dates, then they should be in the form yyyymmdd

which can be achieved using as.Date.

The values of x. num for which predicted values are required. x.pred.values

The actual values to be plotted on the x axis. They are needed when values x.plot.values different to those in x.num are to be plotted or x.fac is to be plotted because

there is no x. num term corresponding to the same term with x. fac.

error.intervals

A character string indicating the type of error interval, if any, to calculate and plot in order to indicate uncertainty in the results. Possible values are "none", "StandardError", "Confidence" and "halfLeastSignificant". The default is for confidence limits to be used. The "halfLeastSignificant" option results in half the mean Least Significant Difference (LSD) being added and subtracted to the predictions, the mean LSD being calculated using the average of the standard errors of all pairwise differences (SEDs) between the predictions. However, if the range of the SEDs divided by the average of the SEDs exceeds avsed. tolerance, calculations and plotting will revert to confidence intervals. Also, half LSDs cannot be used for backtransformed values and so confidence intervals will be used instead.

avsed.tolerance

The values of the range of the SEDs divided by the average of the SEDs that, if exceeded, will cause calculations and plotting to revert to confidence intervals.

It should be a value between 0 and 1.

A logical indicating whether all pairwise differences of the predictions and pairwise their standard errors and p-values are to be computed and stored. If tables is

equal to "differences" or "all" or error.intervals is equal to "halfLeastSignificant",

they will be stored irrespective of the value of pairwise.

tables A character vector containing a combination of none, predictions, backtransforms,

> differences, p. differences, sed, LSD and all. These nominate which components of the alldiffs object to print.

levels.length

The maximum number of characters from the the levels of factors to use in the

row and column labels of the tables of pairwise differences and their p-values

and standard errors.

transform.power

A number specifying the power of a transformation, if one has been applied to the response variable. Unless it is equal to 1, the default, back-transforms of the predictions will be obtained and presented in tables or graphs as appropriate. The back-transformation raises the predictions to the power equal to the reciprocal of transform.power, unless it equals 0 in which case the exponential of the predictions is taken.

x.fac

predictparallel.asreml

offset	A number that	has been added to	each value of the	response after any scaling

and before applying any power transformation.

scale A number by which each value of the response has been multiply before adding

any offset and applying any power transformation.

inestimable.rm A logical indicating whether rows for predictions that are not estimable are to

be removed from the components of thealldiffs object.

wald.tab a data.frame containing the pseudo-anova table for the fixed terms produced by

a call to wald.asreml. The main use of it here is in determining the degrees of freedom of the standard errors of the predictions. denominator degrees of

freedom when p-values or confidence intervals are to be calculated.

alpha the significance level for a test or one minus the confidence level for confidence

intervals.

dDF. na the method to use to obtain approximate denominator degrees of freedom. when

the numeric or algebraic methods produce an NA. Consistent with when no denDF are available, the default is "residual" and so the residual degrees of freedom from asreml.obj\$nedf are used. If dDF.na = "none", no subtitute denominator degrees of freedom are employed; if dDF.na = "maximum", the maximum of those denDF that are available, excluding that for the Intercept, is used; if all denDF are NA, asreml.obj\$nedf is used. If dDF.na = "supplied", a vector of values for the denominator degrees of freedom is to be supplied in dDF.values. Any other setting is ignored and a warning message produced. Generally, substituting these degrees of freedom is anticonservative in that it is

likely that the degrees of freedom used will be too large.

dDF.values A vector of values to be used when dDF.na = "supplied". Its values will be

used when denDF in a test for a fixed effect is NA. This vector must be the same length as the number of fixed terms, including (Intercept) whose value could be

NA.

trace if TRUE then partial iteration details are displayed when ASReml-R functions

are invoked; if FALSE then no output is displayed.

... further arguments passed to predict.asreml.

Value

An alldiffs object with predictions and their standard errors and, depending on the settings of the arguments, all pairwise differences between predictions, their standard errors and p-values and LSD statistics. If power.transform is not one, it will contain a data.frame with the backtransformed predictions. If error.intervals is not "none", then the predictions component and, if present, the backtransforms component will contain columns for the lower and upper values of the limits for the interval. The names of these columns will consist of three parts separated by full stops: 1) the first part will be lower or upper; 2) the second part will be one of Confidence, StandardError or halfLeastSignificant; 3) the third component will be limits.

The name of the response, the term, the classify and tdf, as well as the degrees of freedom of the standard error, will be set as attributes to the object.

38 print.alldiffs

Examples

print.alldiffs

Prints the values in an alldiffs object in a nice format.

Description

Prints the predictions and standard errors from using asreml to fit models in the same way as asreml prints them. Also prints out all pairwise differences between the predictions to 2 significant figures, along with their p-values and standard errors to 4 decimal places. If LSDs are requested the mean. minimum and maximum LSDs will be printed.

Usage

```
## S3 method for class 'alldiffs'
print(x, which = "all", ...)
```

Arguments

x A list returned from asreml.predictiondiffs.

which A character vector containing a combination of predictions, backtransforms,

differences, p. differences, sed, LSD and all. These nominate which com-

ponents of the alldiffs object to print.

... further arguments passed to or from other methods.

Value

No value is returned, but the elements of the list in x, returned from asreml.predictiondiffs, are printed.

print.asrtests 39

Examples

print.asrtests

Prints the values in an asrtests object

Description

Prints a summary of the asreml object and the test.summary data.frame that are stored in the asrtests object.

Usage

```
## S3 method for class 'asrtests'
print(x, which = "all", ...)
```

Arguments

x An asrtests object.

which Which elements of the asrtests object to print. Possible values are some com-

bination of asremlsummary, pseudoanova, testsummary and all.

... further arguments passed to print.

Value

No value is returned, but the elements of the list in x are printed.

See Also

```
asrtests, asremlPlus-package
```

40 recalc.wald.tab.asrtests

```
recalc.wald.tab.asrtests
```

Recalculates the denDF, F.inc and P values for a table of Wald test statistics obtained using wald.asreml

Description

If some or all denDF are not available, either because they are NA or because F.inc values were not calculated, this function allows the user to specify how approximate denDF values are to be obtained. This is done through the dDF. na and dDF. values arguments. Note that if denDF values are available in the Wald table then only those that are NA will be replaced.

Usage

```
recalc.wald.tab.asrtests(asrtests.obj, recalc.wald = FALSE,
                         denDF="default", dDF.na = "none",
                         dDF.values = NULL, trace = FALSE, ...)
```

Arguments

asrtests.obj an asrtests object for a fitted model that is a list containing an asreml object,

a wald.tab data.frame with 4 columns, and a data.frame with 5 columns

that records any previous changes and tests in the fitted model.

recalc.wald a logical indicating whether to call wald. as reml to recalculate the pseudoanova

table for the model fit stored in the asreml object contained in asrtests.

Specifies the method to use in computing approximate denominator degrees of

freedom when wald.asreml is called. Can be none to suppress the computations, numeric for numerical methods, algebraic for algebraic methods or default, the default, to autommatically choose numeric or algebraic computations depending on problem size. The denominator degrees of freedom are calculated according to Kenward and Roger (1997) for fixed terms in the dense

part of the model.

dDF.na The method to use to obtain substitute denominator degrees of freedom. when

> the numeric or algebraic methods produce an NA. If dDF. na = "none", no subtitute denominator degrees of freedom are employed; if dDF.na = "residual",

the residual degrees of freedom from as reml. ob j\$nedf are used; if dDF. na = "maximum",

the maximum of those denDF that are available, excluding that for the Intercept, is used; if all denDF are NA, asreml.obj\$nedf is used. If dDF.na = "supplied", a vector of values for the denominator degrees of freedom is to be supplied in dDF.values. Any other setting is ignored and a warning message produced. Generally, substituting these degrees of freedom is anticonservative in that it is

likely that the degrees of freedom used will be too large.

A vector of values to be used when dDF.na = "supplied". Its values will be

used when denDF in a test for a fixed effect is NA. This vector must be the same length as the number of fixed terms, including (Intercept) whose value could be

trace if TRUE then partial iteration details are displayed when ASReml-R functions

are invoked; if FALSE then no output is displayed.

further arguments passed to asreml and to wald.asreml.

denDF

dDF.values

reml.lrt.asreml 41

Value

A wald. tab: a 4-column data. frame containing a pseudo-anova table for the fixed terms produced by wald.asreml.

See Also

```
asrtests, testranfix.asrtests
```

Examples

reml.lrt.asreml

Performs REML likelihood ratio test.

Description

Extracts the REML log likelhood and number of variance parameters from two asreml objects. It assumes that the second asreml object is the result of fitting a model that is a reduced version of the model for the first object. In the case where the reduced model is obtained by setting positively-constrained variance parameters in the full model to zero, the positive.zero argument should be set to TRUE so that the p-value is computed using a mixture of chi-square distributions as described in Self and Liang (1987).

The function shecks that the models do not differ in either their fixed or sparse models.

The function reml.lrt is provided for backwards compatibility.

Usage

Arguments

```
full.asreml.obj

asreml object for the full model.

reduced.asreml.obj

asreml object for the reduced model.
```

positive.zero Indicates whether the hypothesized values for the variance components being tested are on the boundary of the parameter space. For example, this is true for positively-constrained variance components that, under the reduced model, are zero. This argument does not need to be set if bound.test.parameters is set.

bound.test.parameters

Indicates whether for the variance components being tested, at least some of the hypothesized values are on the boundary of the parameter space. The default is "none". Other possibilities are "onlybound" and "one-and-one". The latter

42 rmboundary.asrtests

signifies that there are two parameters being tested, one of which is bound and the other is not. For example, the latter is true for testing a covariance and a positively-constrained variance component that, under the reduced model, are zero.

Value

A data frame containing the log of the likelihood ratio, its degrees of freedom and its p-value.

Note

The degrees of freedom for the test are computed as the difference between the two models in the number of variance parameters that are unfixed, nonsingular and unconstrained by relationships among them.

This procedure is only approriate when the null hypothesis is that all parameters are on the boundary of the parameter space or that all parameters are in the interior of the parameter space. Mixed cases have been discussed by Self and Liang (1987), but are not implemented here.

## End(Not run)
```

rmboundary.asrtests

Removes any boundary or singular variance components from the fit stored in asreml.obj and records their removal in a data.frame.

Description

Any terms specified in the random model that are estimated on the boundary or are singular and can be removed are removed from the fit stored in an asreml object. Terms that specify multiple parameters in the random model cannot be removed (e.g. terms specified using the at function with more than one level of the factor) and terms in rcov model are not removed. Terms that can be removed are selected for removal in the following order based on whether they involve: (i) a dev function, (ii) only factors, (iii) an spl function, (iv) a pol function and (v) a lin function or a variable that is an integer or a numeric. It should be noted that this order of removal presumes that random deviation terms are specified via the dev function rather than via a random factor. Once the earliest of thes above classes with a boundary term is identified, a term within this class is selected for removal. For all classes, except for factor-only terms, the smallest term with the largest number

rmboundary.asrtests 43

of variables/factors is removed. Amongst factor-only terms, the smallest term with the smallest number of variables/factors is removed. After each variance component is removed, a row for it is added to the test.summary data.frame and the model refitted. If there are further boundary or singular terms, one is removed using the above strategy. This process continues until there are no further boundary or singular variance components that are removable. Other types of boundary or singular terms, which cannot be removed, are reported in warning messages.

Usage

Arguments

asrtests.obj an asrtests object for a fitted model that is a list containing an asreml object,

a wald.tab data.frame with 4 columns, and a data.frame with 5 columns

that records any previous changes and tests in the fitted model.

trace if TRUE then partial iteration details are displayed when ASReml-R functions

are invoked; if FALSE then no output is displayed.

update if TRUE then update.asreml is called to fit the model with any boundary terms

removed. In doing this the arguments R.param and G.param are set to those in the asreml object stored in asrtests.obj so that the values from the previous model are used as starting values. If FALSE then a call is made to asreml in which the only changes from the previous call are that (i) the terms for boundary variance components are removed from the models and (ii) modifications

specified via . . . are made.

set.terms a character vector specifying the terms that are to have constraints and/or initial

values set prior to fitting.

ignore.suffices

a logical vector specifying whether the suffices of the asreml-assigned names of the variance terms (i.e. the information to the right of an "!", other than "R!") is to be ignored in matching elements of terms. If TRUE for an element of terms, the suffices are stripped from the asreml-assigned names. If FALSE for an element of terms, the element must exactly match an asreml-assigned name for a variance term. This vector must be of length one or the same length as terms. If it is of length one then the same action is applied to the asreml-

assigned suffices for all the terms in terms.

constraints a character vector specifying the constraints to be applied to the terms specified

in terms. This vector must be of length one or the same length as terms. If it is of length one then the same constraint is applied to all the terms in terms. If any of the constraints are equal to NA then they are left unchanged for those terms.

initial.values a character vector specifying the initial values for the terms specified in terms.

This vector must be of length one or the same length as terms. If it is of length one then the same initial value is applied to all the terms in terms. If any of the initial values are equal to NA then they are left unchanged for those terms.

... further arguments passed to asreml.

Value

An asrtests object, which is a list containing:

44 setvarianceterms.asreml

1. asreml.obj: an asreml object containing the fit of the model after all boundary and singular terms have been removed;

- 2. wald.tab: a 4-column data.frame containing a pseudo-anova table for the fixed terms produced by wald.asreml;
- 3. test.summary: a data.frame with columns term, DF, denDF, p and action. A row is added to it for each of the boundary terms removed, the row containing the name of the term, one for the DF, NA for the p-value and Boundary for the action.

```

Examples

```
## Not run:
current.asrt <- rmboundary.asrtests(current.asrt)
## End(Not run)</pre>
```

setvarianceterms.asreml

allows the seting of constraints and initial values for terms in the random and rcov arguments of an asreml call, with the resulting call being evaluated.

Description

Takes an unevaluated call and evaluates the call after setting the constraints and initial values for the terms specified in terms. The elements of terms are matched with those generated by asreml and used, for example, in the varcomp component of a summary.asreml object. These names generally include descriptive suffices. To match an element of terms that includes such a suffix, set ignore.suffices to FALSE so that a literal match between the element and the assigned names is sought.

Usage

Arguments

call an unevaluated call to asreml. One way to create such a call is to use the call

function with its name argument set to "asreml". Another is to obtain it from the call component of an asreml object (e.g. call <- asreml.obj\$call).

terms a character vector specifying the terms that are to have constraints and/or initial

values specified.

setvarianceterms.asreml 45

ignore.suffices

a logical vector specifying whether the suffices of the asreml-assigned names of the variance terms (i.e. the information to the right of an "!", other than "R!") is to be ignored in matching elements of terms. If TRUE for an element of terms, the suffices are stripped from the asreml-assigned names. If FALSE for an element of terms, the element must exactly match an asreml-assigned name for a variance term. This vector must be of length one or the same length as terms. If it is of length one then the same action is applied to the asreml-assigned suffices for all the terms in terms.

constraints

a character vector specifying the constraints to be applied to the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same constraint is applied to all the terms in terms. If any of the constraints are equal to NA then they are left unchanged for those terms.

initial.values

a character vector specifying the initial values for the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same initial value is applied to all the terms in terms. If any of the initial values are equal to NA then they are left unchanged for those terms.

additional arguments to be added to the call, or arguments in the call with changed values.

Value

An asreml object.

```

sig.devn.reparam.asrtests

This function reparamterizes each random (deviations) term involving devn.fac to a fixed term and ensures that the same term, with trend.num replacing devn.fac, is included if any other term with trend.num is included in terms.

Description

This function reparamterizes each random (deviations) term involving devn.fac to a fixed term and ensures that the same term with trend.num replacing devn.fac is included if any other term with trend.num is included in terms. It also ansures that any term with spl{trend.num} replacing devn.fac in a term being reparameterized is removed from the model.

Usage

Arguments

terms	a character string	vector giving the terms	that are to be re	enarameterized
tei iiis	a character string	vector giving the terms	mai are to be re	parameterizeu.

asrtests.obj an asrtests object for a fitted model that is a list containing an asreml object,

a wald.tab data.frame with 4 columns, and a data.frame with 5 columns

that records any previous changes and tests in the fitted model.

trend.num A character string giving the name of the numeric covariate that corresponds to

devn. fac and is potentially included in terms in the fitted model.

devn.fac A character string giving the name of the factor that corresponds to trend.num

and is included in terms in the fitted model.

denDF Specifies the enthod to use in computing approximate denominator degrees of

freedom when wald.asreml is called. Can be none to suppress the computations, numeric for numerical methods, algebraic for algebraic methods or default, the default, to autommatically choose numeric or algebraic computations depending on problem size. The denominator degrees of freedom are calculated according to Kenward and Roger (1997) for fixed terms in the dense

part of the model.

trace if TRUE then partial iteration details are displayed when ASReml-R functions

are invoked; if FALSE then no output is displayed.

update if TRUE then update.asreml is called in removing and adding terms to the

model. In doing this the arguments R.param and G.param are set to those in the asreml object stored in the supplied asrtests.obj so that the values from the previous model are used as starting values. If FALSE then calls are made to asreml in which the only changes from the previous call are (i) that the models

are updated and (ii) modifications specified via . . . are made.

set.terms a character vector specifying the terms that are to have constraints and/or initial

values set prior to fitting.

ignore.suffices

a logical vector specifying whether the suffices of the asreml-assigned names of the variance terms (i.e. the information to the right of an "!", other than "R!") is to be ignored in matching elements of terms. If TRUE for an element of terms, the suffices are stripped from the asreml-assigned names. If FALSE for an element of terms, the element must exactly match an asreml-assigned name for a variance term. This vector must be of length one or the same length as terms. If it is of length one then the same action is applied to the asremlassigned suffices for all the terms in terms.

constraints

a character vector specifying the constraints to be applied to the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same constraint is applied to all the terms in terms. If any of the constraints are equal to NA then they are left unchanged for those terms.

initial.values a character vector specifying the initial values for the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same initial value is applied to all the terms in terms. If any of the initial.values are equal to NA then they are left unchanged for those terms.

further arguments passed to asreml via addrm.terms.asrtests.

Value

An asrtests object, which is a list containing:

- 1. asreml.obj: an asreml object containing the fit of the model after all boundary and singular terms have been removed;
- 2. wald.tab: a 4-column data.frame containing a pseudo-anova table for the fixed terms produced by wald.asreml;
- 3. test.summary: a data.frame with columns term, DF, denDF, p and action. It contains a row for each term that is dropped, added or tested or a note that several terms have been added or removed.

```

simulate.asreml 49

```
denDF = "algebraic")
```

End(Not run)

simulate.asreml

Produce sets of simulated data from a multivariate normal distribtion and save quantites related to the simulated data

Description

Produce a set of simulated data corresponding to an asreml model, along with its fitted values and residuals. A variance matrix V, corresponding to the random and rcov models must be supplied. What to save is specified by the which argument.

Usage

Arguments

object	An asreml object from a call to asreml in which the data argument has been

set.

means The vector of means to be used in generating simulated data sets. If it is NULL,

the fitted values based on object are used. It must be the same length as the

response variable for object.

V The fitted variance matrix, i.e. having the pattern and values that conform to

the model fit stored in the supplied object.

nsim The number of data sets to be simulated.

seed A single value, interpreted as an integer, that specifies the starting value of the

random number generator.

tolerance The value such that eigenvalues less than it are consdered to be zero.

update if TRUE then the arguments R. param and G. param are set to those in the asreml

object supplied in object so that the values from the original model are used as starting values. If FALSE then calls are made to asreml in which the only changes from the previous call are (i) the model is fitted to simulated data and (ii) modifications specified via . . . are made, except that changes cannot be

made to any of the models.

trace if TRUE then partial iteration details are displayed when ASReml-R functions are

invoked; if FALSE then no output is displayed.

which The quantites from the simulated data set to be stored. Any combination of

"response", "residuals" and "fitted", or "all". If residuals and/or fitted is specified, those for the analysis stored in object will be added to the data.frame nominated in the data argument of object and the modified data.frame added as a component named data in the list that is the value

returned by the function.

50 simulate.asreml

units A character indicating whether the BLUPs for units are added to the residuals when this reserved factor is included in the random model. Possible values are addtoresiduals and ignore.

Other arguments that are passed down to the function asreml. Changes to the models are not allowed. Other changes are dangerous and generally should be avoided.

Details

Generate nsim set of data and analyse them using asreml using the model in object. Note, if the analysis for a data set does not converge in maxiter iterations, it is discarded and a replacement data set generated. The value of maxiter can be specified in the call to simulate.asreml. The fitted values and residuals are extracted as required. If aom = TRUE when the simulated data are analysed, standardised conditional residuals are stored. If which includes residuals or fitted, the specified quantities for the observed data are added to the data.frame on which the fit in object is based.

Value

A list with the following components whose presence depends on the setting of which:

- 1. **observed:** present if which includes residuals or fitted, in which case it will be the data.frame on which the fit in object is based, with residuals and/or fitted.
- 2. data: present if which includes data, a data. frame containing the simulated data sets.
- 3. **fitted:** present if which includes fitted, a data. frame containing the fitted values from the analyses of the simulated data sets.
- 4. **residuals:** present if which includes residuals, a data. frame containing the residuals from the analyses of the simulated data sets.

testranfix.asrtests 51

testranfix.asrtests

Tests for a single fixed or random term in model fitted using asreml

Description

Tests for a single term, using a REML LRT for a random term or based on Wald statistics for a fixed term. The term must be in the fitted model. A random term is removed from the model fit and a REML likelihood ratio test is performed using reml.lrt.asreml. It compares the fit of the model in asreml.obj and the newly fitted model without the term. If the newly fitted model is retained, any boundary terms are then removed using rmboundary.asrtests. For a fixed term, the probability of the Wald statistics is extracted from the pseudo-anova table produced by wald.asreml. If this is available in the asrtests object, it is used; otherwise wald.asreml is called to add it to the asrtests object. Whether nonsignificant terms are dropped is controlled by drop.ran.ns for random terms and drop.fix.ns for fixed terms. A row is added to the test.summary data.frame for the term that is tested.

Usage

Arguments

term a single model term that is valid in asreml, stored as a character.

asrtests.obj an asrtests object for a fitted model that is a list containing an asreml object,

a wald.tab data.frame with 4 columns, and a data.frame with 5 columns

that records any previous changes and tests in the fitted model.

alpha the significance level for the test.

drop.ran.ns a logical indicating whether to drop a random term from the model when it is

nonsignificant.

positive.zero Indicates whether the hypothesized values for the variance components being

tested are on the boundary of the parameter space. For example, this is true for positively-constrained variance components that, under the reduced model, are zero. This argument does not need to be set if bound.test.parameters is set.

52 testranfix.asrtests

bound.test.parameters

Indicates whether for the variance components being tested, at least some of the hypothesized values are on the boundary of the parameter space. The default is "none". Other possibilities are "onlybound" and "one-and-one". The latter signifies that there are two parameters being tested, one of which is bound and the other is not. For example, the latter is true for testing a covariance and a positively-constrained variance component that, under the reduced model, are zero.

drop.fix.ns

a logical indicating whether to drop a fixed term from the model when it is nonsignificant

denDF

Specifies the enthod to use in computing approximate denominator degrees of freedom when wald.asreml is called. Can be none to suppress the computations, numeric for numerical methods, algebraic for algebraic methods or default, the default, to autommatically choose numeric or algebraic computations depending on problem size. The denominator degrees of freedom are calculated according to Kenward and Roger (1997) for fixed terms in the dense part of the model.

dDF.na

the method to use to obtain substitute denominator degrees of freedom. when the numeric or algebraic methods produce an NA. If dDF.na = "none", no subtitute denominator degrees of freedom are employed; if dDF.na = "residual", the residual degrees of freedom from asreml.obj\$nedf are used; if dDF.na = "maximum", the maximum of those denDF that are available, excluding that for the Intercept, is used; if all denDF are NA, asreml.obj\$nedf is used. If dDF.na = "supplied", a vector of values for the denominator degrees of freedom is to be supplied in dDF.values. Any other setting is ignored and a warning message produced. Generally, substituting these degrees of freedom is anticonservative in that it is likely that the degrees of freedom used will be too large.

dDF.values

A vector of values to be used when dDF.na = "supplied". Its values will be used when denDF in a test for a fixed effect is NA. This vector must be the same length as the number of fixed terms, including (Intercept) whose value could be NA.

trace

if TRUE then partial iteration details are displayed when ASReml-R functions are invoked; if FALSE then no output is displayed.

update

if TRUE then update.asreml is called to fit the model to be tested. In doing this the arguments R.param and G.param are set to those in the asreml object stored in asrtests.obj so that the values from the previous model are used as starting values. If FALSE then a call is made to asreml in which the only changes from the previous call are that (i) models are modified for the supplied terms and (ii) modifications specified via . . . are made.

set.terms

a character vector specifying the terms that are to have constraints and/or initial values set prior to fitting.

ignore.suffices

a logical vector specifying whether the suffices of the asreml-assigned names of the variance terms (i.e. the information to the right of an "!", other than "R!") is to be ignored in matching elements of terms. If TRUE for an element of terms, the suffices are stripped from the asreml-assigned names. If FALSE for an element of terms, the element must exactly match an asreml-assigned name for a variance term. This vector must be of length one or the same length as terms. If it is of length one then the same action is applied to the asreml-assigned suffices for all the terms in terms.

testranfix.asrtests 53

constraints

a character vector specifying the constraints to be applied to the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same constraint is applied to all the terms in terms. If any of the constraints are equal to NA then they are left unchanged for those terms.

initial.values a character vector specifying the initial values for the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same initial value is applied to all the terms in terms. If any of the initial.values are equal to NA then they are left unchanged for those terms.

further arguments passed to asreml and to wald.asreml.

Value

An asrtests object, which is a list containing:

- 1. asreml.obj: an asreml object containing the fit after the term has been tested; it will be a new model if the term is nonsignificant and the appropriate argument out of drop.ran.ns and drop.fix.ns is TRUE;
- 2. wald.tab: a 4-column data.frame containing a pseudo-anova table for the fixed terms produced by wald.asreml;
- 3. test.summary: a data.frame with columns term, DF, denDF, p and action. A row is added to it for each term that is tested, the row containing the name of the term, the degrees of freedom (numerator DF for a Wald test and the number of extra paramters for a REML ratio tests), the p-value and a for the action taken. Possible codes are: Dropped, Retained, Significant, Nonsignificant, Absent, Added, Removed and Boundary. If the changed model did not converge, Unconverged will be added to the code. Note that the logical asreml.obj\$converge also reflects whether there is convergence.

If the term is not in the model, then the supplied asreml object will be returned. Also, reml.test will have the likelihood ratio and the p-value set to NA and the degrees of freedom to zero. Similarly, the row of test. summary for the term will have its name, DF set to NA, p-value set to NA, and action set to Absent.

54 testrcov.asrtests

testrcov.asrtests Fits a new rcov formula using asreml and tests whether the change is significant.

Description

Fits a new roov formula using asreml and tests whether the change is significant. If simpler = FALSE the model to be fitted must be more complex than the one whose fit has been stored in asrtests.obj. That is, the new model must have more parameters. However, if simpler = TRUE the model to be fitted must be simpler than the one whose fit has been stored in asrtests.obj in that it must have fewer parameters. Any boundary terms are removed using rmboundary.asrtests, which may mean that the models are not nested. The test is a REML likelihood ratio test that is performed using reml.lrt.asreml, which is only valid if the models are nested. It compares the newly fitted model with the fit of the model in asrtest.obj. A row is added to the test.summary data.frame using the supplied label.

Usage

Arguments

terms a model for the rcov argument in asreml, stored as a character.

asrtests.obj an asrtests object for a fitted model that is a list containing an asreml object,

a wald.tab data.frame with 4 columns, and a data.frame with 5 columns

that records any previous changes and tests in the fitted model.

label a character string to use as the label in test.summary and which indicates what

is being tested.

simpler a logical indicating whether the new model to be fitted is simpler than the already

fitted model whose fit is stored in asrtests.obj.

alpha the significance level for the test.

positive.zero Indicates whether the hypothesized values for the variance components being

tested are on the boundary of the parameter space. For example, this is true for positively-constrained variance components that, under the reduced model, are zero. This argument does not need to be set if bound.test.parameters is set.

bound.test.parameters

Indicates whether for the variance components being tested, at least some of the hypothesized values are on the boundary of the parameter space. The default is "none". Other possibilities are "onlybound" and "one-and-one". The latter signifies that there are two parameters being tested, one of which is bound and the other is not. For example, the latter is true for testing a covariance and a positively-constrained variance component that, under the reduced model, are zero.

55 testrcov.asrtests

denDF

Specifies the method to use in computing approximate denominator degrees of freedom when wald.asreml is called. Can be none to suppress the computations, numeric for numerical methods, algebraic for algebraic methods or default, the default, to autommatically choose numeric or algebraic computations depending on problem size. The denominator degrees of freedom are calculated according to Kenward and Roger (1997) for fixed terms in the dense part of the model.

update

if TRUE then update.asreml is called to fit the model with the rcov model supplied in terms. In doing this the arguments R.param and G.param are set to those in the asreml object stored in asrtests.obj so that the values from the previous model are used as starting values. If FALSE then a call is made to asreml in which the only changes from the previous call are that (i) rcov model is that specified in terms and (ii) modifications specified via . . . are made.

trace

if TRUE then partial iteration details are displayed when ASReml-R functions are invoked; if FALSE then no output is displayed.

set.terms

a character vector specifying the terms that are to have constraints and/or initial values set prior to fitting.

ignore.suffices

a logical vector specifying whether the suffices of the asreml-assigned names of the variance terms (i.e. the information to the right of an "!", other than "R!") is to be ignored in matching elements of terms. If TRUE for an element of terms, the suffices are stripped from the asreml-assigned names. If FALSE for an element of terms, the element must exactly match an asreml-assigned name for a variance term. This vector must be of length one or the same length as terms. If it is of length one then the same action is applied to the asremlassigned suffices for all the terms in terms.

constraints

a character vector specifying the constraints to be applied to the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same constraint is applied to all the terms in terms. If any of the constraints are equal to NA then they are left unchanged for those terms.

initial.values a character vector specifying the initial values for the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same initial value is applied to all the terms in terms. If any of the initial.values are equal to NA then they are left unchanged for those terms.

further arguments passed to asreml and to wald.asreml.

Value

An asrtests object, which is a list containing:

- 1. asreml.obj: an asreml object containing the fit after the term has been omitted from the model:
- 2. wald.tab: a 4-column data.frame containing a pseudo-anova table for the fixed terms produced by wald.asreml;
- 3. test.summary: a data.frame with columns term, DF, denDF, p and action. A row is added to it for each term that is dropped, added or tested or a note that several terms have been added or removed. A row contains the name of the term, the DF, the p-value and the action taken. Possible codes are: Dropped, Retained, Swapped, Unswapped, Significant, Nonsignificant, Absent, Added, Removed and Boundary. If the changed model did not converge, Unconverged will be added to the code. Note that the logical asreml.obj\$converge also reflects whether there is convergence.

56 testswapran.asrtests

If the term is not in the model, then the supplied asreml object will be returned. Also, reml.test will have the likelihood ratio and the p-value set to NA and the degrees of freedom to zero. Similarly, the row of test.summary for the term will have its name, a p-value set to NA, and action set to Absent.

```

Examples

testswapran.asrtests

Tests, using a REMLRT, whether the difference between current random model and one in which oldterms are dropped and newterms are added is significant.

Description

Fits a new random model using asreml by removing oldterms and adding newterms. If simpler = FALSE the model to be fitted must be more complex than the one whose fit has been stored in asrtests.obj. That is, the new model must have more parameters. However, if simpler = TRUE the model to be fitted must be simpler than the one whose fit has been stored in asrtests.obj in that it must have fewer parameters. The test is a REML ratio test that is performed using reml.lrt.asreml, which is only valid if the models are nested. It compares the newly fitted model with the fit of the model in asrtest.obj. A row is added to the test.summary data.frame using the supplied label. If the newly fitted model is retained, any boundary terms are then removed using rmboundary.asrtests.

Usage

testswapran.asrtests 57

Arguments

oldterms terms, stored as a character, that are to be removed from the random model

using asreml.

newterms terms, stored as a character, that are to be added to the random model using

asreml.

asrtests.obj an asrtests object for a fitted model that is a list containing an asreml object,

a wald.tab data.frame with 4 columns, and a data.frame with 5 columns

that records any previous changes and tests in the fitted model.

simpler a logical indicating whether the new model to be fitted. after the changes made

as a result of swapping oldterms for newterms, is simpler than the already fitted

model whose fit is stored in asrtests.obj.

alpha the significance level for the test.

label a character string to use as the label in test. summary and which indicates what

is being tested.

tested are on the boundary of the parameter space. For example, this is true for positively-constrained variance components that, under the reduced model, are zero. This argument does not need to be set if bound.test.parameters is set.

bound.test.parameters

Indicates whether for the variance components being tested, at least some of the hypothesized values are on the boundary of the parameter space. The default is "none". Other possibilities are "onlybound" and "one-and-one". The latter signifies that there are two parameters being tested, one of which is bound and the other is not. For example, the latter is true for testing a covariance and a positively-constrained variance component that, under the reduced model, are

zero.

denDF Specifies the enthod to use in computing approximate denominator degrees of

freedom when wald.asreml is called. Can be none to suppress the computations, numeric for numerical methods, algebraic for algebraic methods or default, the default, to autommatically choose numeric or algebraic computations depending on problem size. The denominator degrees of freedom are calculated according to Kenward and Roger (1997) for fixed terms in the dense

part of the model.

trace if TRUE then partial iteration details are displayed when ASReml-R functions

are invoked; if FALSE then no output is displayed.

update if TRUE then update.asreml is called to change the model. In doing this the

arguments R.param and G.param are set to those in the asreml object stored in asrtests.obj so that the values from the previous model are used as starting values. If FALSE then a call is made to asreml in which the only changes from the previous call are that (i) models are modified for the supplied oldterms and

newterms, and (ii) modifications specified via . . . are made.

set.terms a character vector specifying the terms that are to have constraints and/or initial

values set prior to fitting.

ignore.suffices

a logical vector specifying whether the suffices of the asreml-assigned names of the variance terms (i.e. the information to the right of an "!", other than "R!") is to be ignored in matching elements of terms. If TRUE for an element of terms, the suffices are stripped from the asreml-assigned names. If FALSE

58 testswapran.asrtests

> for an element of terms, the element must exactly match an asreml-assigned name for a variance term. This vector must be of length one or the same length as terms. If it is of length one then the same action is applied to the asremlassigned suffices for all the terms in terms.

constraints

a character vector specifying the constraints to be applied to the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same constraint is applied to all the terms in terms. If any of the constraints are equal to NA then they are left unchanged for those terms.

initial.values a character vector specifying the initial values for the terms specified in terms. This vector must be of length one or the same length as terms. If it is of length one then the same initial value is applied to all the terms in terms. If any of the initial.values are equal to NA then they are left unchanged for those terms.

further arguments passed to asreml and wald.asreml.

Value

An asrtests object, which is a list containing:

- 1. asreml.obj: an asreml object containing the fit after the term has been omitted from the model;
- 2. wald.tab: a 4-column data.frame containing a pseudo-anova table for the fixed terms produced by wald.asreml;
- 3. test.summary: a data.frame with columns term, DF, denDF, p and action. A row is added to it for each term that is dropped, added or tested or a note that several terms have been added or removed. A row contains the name of the term, the DF, the p-value and the action taken. Possible codes are: Dropped, Retained, Swapped, Unswapped, Significant, Nonsignificant, Absent, Added, Removed and Boundary. If the changed model did not converge, Unconverged will be added to the code. Note that the logical asreml.obj\$converge also reflects whether there is convergence.

If the term is not in the model, then the supplied asreml object will be returned. Also, reml.test will have the likelihood ratio and the p-value set to NA and the degrees of freedom to zero. Similarly, the row of test.summary for the term will have its name, a p-value set to NA, and action set to Absent.

variofaces.asreml 59

variofaces.asreml	plot empirical variogram faces, including envelopes, as described by
	Stefanova, Smith & Cullis (2009)

Description

A function that produces a plot for each face of an empirical 2D variogram based on residuals produced after the fitting of a model using the function asreml. It also adds envelopes to the plot by simulating data sets from a multivariate normal distribution with expectation equal to the fitted values obtained from the fixed and spline terms and variance matrix equal to the fitted variance matrix (Stefanova, Smith & Cullis, 2009). The plot is constrolled by the rcov model, which must consist of two factors corresponding to the two physical dimensions underlying the data. It can also have a third term involving the at function that defines sections of the data, such as experiments in different environments. In this case, the two variogram faces are produced for each section.

Usage

Arguments

trace

O	
object	An asreml object from a call to asreml in which the data argument has been set.
means	The vector of means to be used in generating simulated data sets. If it is NULL, the fitted values based on object are used. It must be the same length as the response variable for object.
V	The fitted variance matrix, i.e. having the appropriate pattern and values given the model fitted to the observed data and the estimates of the parameters obtained.
nsim	The number of data sets to be simulated in obtaining the envelopes.
seed	A single value, interpreted as an integer, that specifies the starting value of the random number generator.
tolerance	The value such that eigenvalues less than it are consdered to be zero.
units	A character indicating whether the BLUPs for units are added to the residuals when this reserved factor is included in the random model. Possible values are addtoresiduals and ignore. If standardized conditional residuals are plotted and the BLUPs for units are to be added then it is the standardized BLUPs that are added.
update	if TRUE then the arguments R.param and G.param are set to those in the asreml object supplied in object so that the values from the original model are used as starting values. If FALSE then calls are made to asreml in which the only changes from the previous call are (i) the model is fitted to simulated data and (ii) modifications specified via are made, except that changes cannot be made to any of the models.

are invoked; if FALSE then no output is displayed.

if TRUE then partial iteration details are displayed when ASReml-R functions

60 variofaces.asreml

graphics.device

A character specifying a graphics device for plotting. The default is graphics.device = NULL, which will result in plots being produced on the current graphics device. Setting it to "windows", for example, will result in a windows graphics device being opened.

Other arguments that are passed down to the function asreml. Changes to the models are not allowed. Other changes are dangerous and generally should be avoided.

Details

The rcov model is scanned to ensure that it involves only two factors not included in the at function, and to see if it has a third factor in an at function. If so, the faces of the 2D variogram, each based on one of the two non-at factors, are derived from the residuals in the supplied asreml object using asreml.variogram, this yielding the observed variogram faces. If aom was set to TRUE for the asreml object, the standardized consitional residuals are used. Then nsim data sets are generated by adding the fitted.values, extracted from the asreml object, to a vector of values randomly generated from a normal distribution with expectation zero and variance matrix V. Each data set is analyzed using the model in object and the variogram values for the faces are obtained using asreml.variogram stored. Note, if the analysis for a data set does not converge in maxiter iterations, it is discarded and a replacement data set generated. The value of maxiter can be specified in the call to variofaces.asreml. Plots are produced for each face and include the observed values and the 2.5%, 50% & 97.5% quantiles.

Value

A list with the following components:

- face1: a data. frame containing the variogram values on which the plot for the first dimension is based.
- 2. **face2:** a data.frame containing the variogram values on which the plot for the second dimension is based.

62 Wheat.dat

Wheat.dat

Data for an experiment to investigate 25 varieties of wheat

Description

The data appears in Gilmour et al. [1995] and is from a field experiment designed to compare the performance of 25 varieties of wheat. An analysis of it using asreml is presented by Butler et al. (2010, Sectoion 8.6), although they suggest that it is a barley experiment. It is used in asremlPlus-package as an executable example of the use of the asremlPlus to analyse a data set.

The experiment was conducted at Slate Hall Farm, UK, in 1976 and was designed as a balanced lattice square with 6 replicates laid out in a 10×15 rectangular grid. The columns in the data frame are: Rep, Row, Column, WithinColPairs, Variety, yield. The response variable is the grain yield.

Usage

data(Wheat.dat)

Format

A data frame containing 150 observations of 6 variables.
